

See where your storage is heading.

IOportal is a cloud service that turns your Hitachi storage into reports you can rely on: deep enough to answer the real question, drawn from the same readings Hitachi engineers use. What you see holds up.

HIGHLIGHTS

Answers, not just numbers.

The cause, not a guess

See which server or application is driving the load, and exactly where it lands on the storage. You stop guessing whether the cause is the application or the array.

Capacity forecasts you can plan on

Every pool gets a real projection months ahead, with a confidence range around it, so you expand before a pool runs short rather than after.

The whole lifecycle, kept

The most recent year stays at the finest resolution, and five years is kept by the hour. Real history, never thinned out to averages.

Compared against the field

See how your systems perform against many real Hitachi systems in production, so you know whether your numbers are actually good, not just what they are.

SECURITY

Simple deployment. Secure upload. Cloud insights.

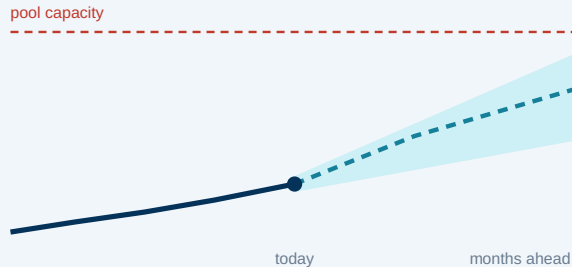

It all starts on a server inside your own network. From there, everything travels to the cloud over an encrypted connection, and becomes graphs you open from any browser.

WHAT A REPORT ANSWERS

Made to be read, not decoded.

Capacity forecast

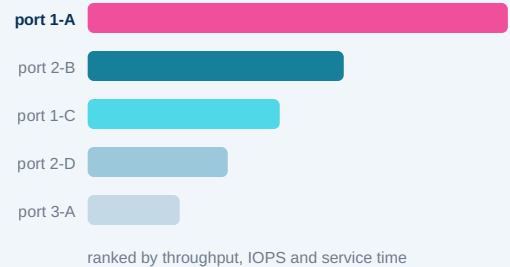

with a confidence range

Read: this pool runs short within months. The expansion is planned ahead, not ordered in a panic.

Find what is driving the load

every port ranked

Read: the resource driving the load sits right at the top of the list instead of buried in it.

PEACE OF MIND

We run it. You use it.

GETTING STARTED

Connected, the work is ours.

You provide a small server as an upload buffer, and we do the rest: connect your Hitachi systems and set the service up for your environment, so the reporting is there from the first day.

FROM THEN ON

Kept running, kept current.

We run the service and keep it up to date as your estate changes, and we stay reachable when a question comes up. You never carry the operation yourself.

ALSO IN THE BOX

Down to the single volume

From the whole estate through server, port and volume, with the heaviest consumers ranked for you.

Reports you can hand over

Add your own comments, save a view as a PDF, or export the figures as CSV.

Every Hitachi generation

G/F-Series, VSP 5000, E-Series and VSP One, side by side in one view.

See it on your own numbers.

Book a demo. With a small buffer server on your side, the reporting is there from the first day.
